Profile

Quality engineer with 15+ years in software quality and 10+ in test automation, most recently owning quality for a multi-instance crypto payments platform and leading a 5-engineer QA team across 4 countries. Built that platform's automation from zero to 149 tests across API, integration and UI, running nightly in CI. Has built test frameworks from nothing three times, and is as comfortable in a scrum team as running a QA function.

Technical skills

Languages TypeScript, C#, .NET, Java, SQL

Test frameworks Playwright, Cypress, Selenium, xUnit, NUnit, SpecFlow, Cucumber, JMeter

API & integration REST, webhooks / IPN, SQL data validation, Postman, SoapUI, Zod response schemas

CI/CD & cloud GitHub Actions, Azure DevOps, AWS, Jenkins, OpenShift, Git, BrowserStack

Test management TestRail, PractiTest, Jira, Confluence, Kibana

Public repo: github.com/s-petrov8/playwright-qa-portfolio — 47 tests (36 API / 10 UI), Zod contracts, CI

Work experience

Lead QA Engineer — Coinpayments (Remote) · Aug 2025 – Aug 2026

TypeScript, Playwright, C#, xUnit, AWS, Azure DevOps → GitHub Actions

- Owned quality for a live multi-instance crypto payments platform — 4 production instances, 12+ blockchains, checkout, invoicing, payouts and admin tooling.
- Built the platform's test automation from zero — 149 tests in 12 months across two suites: 96 API/integration in C#/xUnit, later TypeScript, and 53 Playwright e2e, both nightly in GitHub Actions.
- Eliminated the original manual regression bottleneck: transaction happy-path scenarios that had consumed 3+ working days of manual execution per release are fully automated; manual regression now runs in one day.
- Delegated release ownership — planning, sequencing, execution and go/no-go — to a senior QA engineer. The team then ran two full production release cycles during my absences with no escalations, independently catching a production double-transaction defect and driving a rollback.
- Led and mentored 5 QA engineers across 4 countries: biweekly 1:1s, development goals, and peer review established inside the team so test plans and automation PRs stopped routing through me.
- Found and drove defects with direct financial exposure — payment-address reuse risking misapplied funds, an admin export silently omitting transactions, and a network fee the company was absorbing.

Senior Automation Engineer — Regate (Remote) · Mar 2023 – Jun 2025

Cypress, Cypress Cloud, TypeScript, GitHub Actions, UiPath

- Built complex inter-system integration tests in TypeScript and Cypress, integrating the product with third-party systems.
- Embedded in the development team — read the backend and reviewed pull requests — and coordinated 3 QA engineers while shaping the team's QA process without reporting authority.

Senior Automation QA Engineer — Ascent (Remote) · Mar 2021 – Jan 2023

C#, .NET, Selenium, xUnit, NUnit, SpecFlow, Azure DevOps, JMeter

- Sole QA engineer: built the backend and UI automation frameworks from scratch, with BDD and BrowserStack.
- Ran JMeter load, stress and spike testing against a service wrapping a third-party e-commerce API, measuring throughput and error rate to find the load at which the upstream API degraded.

QA Engineer — Experian (Sofia, Bulgaria) · Nov 2018 – Jan 2021

Java, Selenium, Jenkins, OpenShift, Cucumber, JMeter

- Lead quality practitioner in a scrum team, building microservice test automation in Java and Selenium, on an enterprise on-premise product with multiple client versions maintained in parallel.

QA Engineer — DAIS Software (Sofia, Bulgaria) · May 2008 – Sep 2015

Java, Selenium, SQL

- Sole QA engineer: owned the full QA process from design-stage testability through to deployment, including contract-first SOAP web-service testing against WSDL and XSD schemas.
